Comparison Manual and CVT Transmission for a Car Under 1 Liter Engine Dec 26 2020 This thesis presented about comparison manual and CVT transmission. This thesis deals with analysis on performance of transmission for a car under 1 liter engine. The objective of this thesis is to compare the performance of transmission between manual transmission and CVT transmission. Besides that, the purpose of this thesis is to analyze the performance of the Manual Transmission and the CVT Transmission for a car under 1 liter engine. This thesis also purposes to study the suitability using CVT for a car under 1 liter engine. Manual transmission and CVT transmission have their own advantages and one of that is better in their performance. In performance, there are many category that compared consist of power available, tractive force, fuel consumption and many more. The data used for the analysis is obtained through calculation using specification data that has got from brochure which is downloaded from Toyota's official web because this model only market at Europe. This model fulfilled this project because it had two types of transmission which is CVT transmission and Manual Transmission. The post-processing method was performed using manual calculation with certain engineering formula and graph is plotted by using assistance software such as Microsoft Excel. The post-processing method to analyze the performance of

transmission was performed using the SAE definition. From the results, it is observed that the performance of CVT is better than manual transmission. It is also observed that Manual Transmission is better than CVT in term of fuel consumption for a car under 1 liter engine. Besides that, CVT are suitable to use for a car under 1 liter engine because it gives more power and ride comfort ability. Future work, this comparison between manual transmission and CVT must do in experimental or simulation since CVT technology just begun to blossom to Malaysia. There are many factors that required to do research by experimental especially in transmission's performance and driveability.

Automated Manual Transmission Mode Selection Controller

Mar 17 2020 A powertrain system for a hybrid vehicle. The hybrid vehicle includes a heat engine, such as a diesel engine, and an electric machine, which operates as both an electric motor and an alternator, to power the vehicle. The hybrid vehicle also includes a manual-style transmission configured to operate as an automatic transmission from the perspective of the driver. The engine and the electric machine drive an input shaft which in turn drives an output shaft of the transmission. In addition to driving the transmission, the electric machine regulates the speed of the input shaft in order to synchronize the input shaft during either an upshift or downshift of the transmission by either decreasing or increasing the speed of the input shaft. When decreasing the speed of the input shaft, the electric motor functions as an alternator to produce electrical energy which may be stored by a storage device. Operation of the transmission is controlled by a transmission controller which receives input signals and

generates output signals to control shift and clutch motors to effect smooth launch, upshift shifts, and downshifts of the transmission, so that the transmission functions substantially as an automatic transmission from the perspective of the driver, while internally substantially functioning as a manual transmission.

Visual Performance Feedback System for a Gear Shift in a Manual Transmission Vehicle Dec 06 2021 Abstract: The manual transmission (MT) automobile allows for a unique driving experience. The MT is unlike other vehicle transmissions, like an

automatic or continuously variable transmission (CVT), in that the driver is in control of the transmission. The reward and appreciation of driving an MT vehicle efficiently and properly comes with the daunting challenge of learning how to properly shift gears. This gear shift skill is required to shift gears up (upshift) and down (downshift) by using the clutch pedal and the shift selector. If the driver does not perform the upshift or downshift operation smoothly (match engine and transmission speed), then the vehicle and occupants experience a noticeable and uncomfortable jolt. Since the engine and transmission are to move at a relational rate of speed, when a driveline jolt occurs there is likely an observable characteristic that may indicate an incorrect shift. This thesis project explores a proof of concept aimed to provide direct visual shift performance feedback to the driver of an MT vehicle by using visual cues (LED lights and an LCD display). The feedback system identifies an upshift or downshift while also identifying a good shift or bad shift. When a bad shift is determined, the device defines the cause of the poor performance. This will provide the driver insight on how to improve the shift and help to identify common issues to improve. The logic of the feedback system is derived from an experiment with an experienced MT driver. Of the total 269 identified shifts, the system correctly identified 150 good and 39 bad shifts with their reason of poor performance. This resulted in an overall accuracy of 70.3%. The implementation of this device will help increase the longevity of the vehicle components by reducing transmission wear or damage while also helping new and current drivers to master the gear shift operation.

Gear Change Selection and Clutch Control of an Automated Manual Transmission Vehicle Nov 05 2021 The aim of this report is to provide a detailed overview of Automated Manual Transmissions (AMT) from its control point of view. An introduction about AMT is given, stating its main advantages in terms of cost and efficiency compared to other transmission types and justifying the context which makes AMT an interesting system for investigation. It is stated as well its importance for the Ford Focus prototype vehicle, where the project will carry the investigation. This leads to the aim and objectives. Then, previous research about AMT is summarized. Starting with the common problems of AMT, some proposed control strategies follow, which aim to solve the discussed problems. As well, AMTs actuator control strategies are presented. All this analysis led to some recommendations which guide the next steps of the project. Continuing with, the vehicle is introduced with major emphasis on the AMT system. It is explained the present components and new drivers that are designed and built, which provide the functionality needed for the AMT. Next, the controller architecture development process is discussed. Starting from the low-level controllers for each of the AMT actuators, it is explained the strategy used to achieve the control of them. It includes an interesting discussion on how to use the sensors present on the actuators to achieve position control without position feedback. Then, it follows the details on how each actuator is integrated in high-level controllers until achieving the complete control of the AMT successfully. Finally, some conclusions are drawn stating the importance of the feedback sensors for gearbox controllers and the clutch control concerns. Guidance is as well given for further investigation on the AMT system of the prototype vehicle.
